

New Hospital Programme Digital Blueprint & Financial Model

29-Oct-2021

Methodology

Publish

Vision of the hospital of the future including design principles

Guidance on technology and data that will help design the hospital of future

Examples of Personas and Journeys of the future workforce and patient, incl. some technologies they will use

Artefacts including research on best practices/ exemplars to support next wave of NHP hospitals

Decision making aids in the form of checklists

Digital Hospital Framework

The framework for the digital hospital is organised using the components below in order to reduce the size and complexity of key factors for consideration:

The system adjustments required to move hospitals from their current states to the desired state described in the vision The goals and aspirations for the digital hospital of the future The core concepts emerging from the vision

Essential rules to consider at every stage of the digital hospital planning, design and build to ensure comprehensive coverage of all things digital

The Atos NHSX Digital Capability Model

Personas and Journey Maps Visualisation of the user experience

NHP Personas

Future state patient and staff personas exemplify the user's future needs, experiences, behaviours and goals, which is valuable to **drive design decisions**. Building future personas **humanises** the different audiences that the NHP sites will influence, building empathy and engagement. Personas are valuable on their own, as they can be used to plan for future roles, including the future technology and data to consider. For this project, 3 patient personas have been created, and five staff personas.

NHP Journey Maps

Whilst personas are valuable on their own, it is useful to take them one step further and create a persona journey map. A persona journey map is where a persona's end to end experience with the trust is stepped out and the different technology and data involved in the journey is identified. This is a valuable step in creating a **positive patient and staff experience**, as it allows the identification of steps and interactions that the patients will have with the future hospital. For this project, four persona journey maps have been created, including two patient and two staff.

Petya

Adult inpatient

FUTURE STATE - 2030

Story

- Petya is visually impaired and suffers from COPD, due to smoking for almost 50 years. Petya has a family carer, Lina her daughter, however she is becoming increasingly independent due to the remote technology she now has.
- Unfortunately Petya has become unwell with a chest infection leading to sepsis, meaning she is now having to spend some time in hospital as in inpatient whilst she is treated.
- Petya's English is limited, so she struggles when there is no Bulgarian translation.

Digital confidence

25%

Communication method of choice

SMS Me

ail

- Be as independent as possible in the comfort of her own home
- Avoid being a burden on anyone
- Utilise technology and data to address any challenges due to her visual impairment
- Always stay connected to family

• Finds some of the remote technology challenging to use when keep in touch with family and using remote monitoring

Profile

Female

London

Eastern European

- Not fluent in English, so often struggles with language barrier
- Doesn't feel comfortable in hospitals as not used to surroundings, like she is at home due to her poor sight

O

 $(\tilde{\gamma})$

Key technologies used

- Voice assistance (Alexa)
- Assistive technology/screen reader for phone

Ø

- Smart pill dispenser
- COPD RPM technology
- Translated audiobooks
- Voice activated translation technology
- Video conferencing
- Virtual ward

Day in the Life

Petya – Adult Inpatient

FUTURE STATE - 2030

Phase 2

Delivered across 3 workstreams:

- A **financial model** to support development of business cases
- A practical **"how to" guide** to support development of the digital transformation journey using the blueprint
- A **supplier briefing pack** proposing a market engagement framework to support digital procurement

Technology Research

Desk-based and SME research of digital technology use cases, costs and benefits

Financial Workbook

Digital Technology maturity classification

With systems and technologies mapped to capabilities they are categorised to provide additional guidance on priority for selection.

Physical Footprint Model

Apply % improvements to the following factors based on research

Emergency Department Reduced Attendances, Reduced Time, Admission Avoidance

Reduced Length of Stay

Increased day-case throughput

Outpatients Reduced activity, DNAs, follow-ups, face-to-face, time Increased utilisation

Theatres Reduced elective activity, reduced time, increased utilisation

Imaging Reduced activity, reduced time, increased utilisation

Digital technologies, costs and benefits

 \heartsuit

Value Category	Value Category Description
Physical footprint reduction	Space required by a service is reduced by certain amount
FTE	Better workforce utilisation resulting in better human interaction time
Patient throughput	More patient services provided in a set amount of time
Materials	Reduction in the materials usage
Efficiency	Reduction in time spent on non-value adding tasks (DNA, Admin tasks etc.)
Patient Experience	Added value to the patient experience
Green Factor	Reduction in waste and/or wider environmental benefits
Safety	Improvement in all safety aspects

Establish costs

- Identify system and technology implementation costs for new technologies
- Determine implementation strategy and costs for legacy systems (see below)

Determine value

Research and identify benefits
 of implementing each
 technology

Model cost and value

ĩŌ

- Define costs for each year of technology implementation
- Determine benefits profile
 quantifying year on year return

Procurement

- Identify appropriate
 procurement routes
- Determine cost effectiveness of central vs. local procurement

Strategy	Strategy description	Cost Impact
Coordination	Modification of the existing system for integration to new operation will incur a cost	20%
Unification	Utilisation of the existing systems from previous operations incurs minimal cost of implementation	5%
Diversification	Implementation of new technology component within the existing operation will incur a cost	35%
Replication	Discrete implementation of an existing system for NHP site	100%

Technology Research

Telemedicine example	Data
Cost of outpatient appointment < link >	£120
NHS guidelines for outpatient appointment duration (mins) < link >	20
Minutes saved per virtual appointment < link >	2.5
Percentage time savings per virtual appointment	13%
Cost savings per virtual appt (13% of £120)	£15
NHP site expected outpatient appointments	500,000
Assumption: % of all outpatient appts to virtualise	30%
NHP site number of virtual outpatient appts (30% of 500,000)	150,000
Potential savings from virtual outpatient appointments (150,000x£15)	£2.250.000

Technology research summary

Each technology of the future "Digital Hospital" is researched and evaluated, capturing costs and calculating value year-on-year. **Digital Front Door**

Capability	3F Linkage	Foundation Advanced Prime Premium	Prerequisite Technology Components	Value Statement	Value Category	Implementatio n Cost	Annual Run Cost	Annual Savings
Patient Administration	Footprint	Advanced	Network Infrastructure, Wireless Infrastructure, 4G/5G Infrastructure	-		£400.000	£200,000	£2,130,000
				Reduction of calls for booking services	FTE	£200,000	£100,000	£1,020,000
				Reduction of DNA as a result of patient self- bookings	Efficiency	£150,000	£80,000	£830,000
Figures for illustr purposes only	ative			Paperless solution will reduce the amount of physical correspondence required	FTE	£50,000	£20,000	£280,000

Digital Technology business case input

The NHP Digital Blueprint builds on the capability and technology assessment of Phase 1 and creates a generic financial model which may be used and tailored by NHP sites to feed into their business case.

Thank you!
